

SEASONAL PLANNING & CARE

CONGRATULATIONS ON YOUR PREMIUM TURF! YOU'VE GOT A STUNNING FINE LEAF VARIETY, RENOWNED FOR ITS RICH COLOUR AND LUXURIOUS APPEARANCE.

SPRING

- **Cutback:** Once the lawn is producing new growth, mow low, removing as much of the leaf as possible. You will find that you will empty the catcher many times and that lawn will be yellow and bare when finished – perfectly normal for this process.

- **Topdress:** After the cutback, evenly throw out a granular wetting agent. Then topdress with Rocket Topdress at 10mm depth across the lawn. Water in well. This will rehydrate, feed and fix unevenness in the lawn. This can be done at anytime during the growing season.

- **Mowing:** Should start 14–21 days after topdressing. Mow every 10–14 days as the weather warms. Sir Grange can be mowed as low as 10mm and as high as un-mowed! Mow as soon as the grass reaches the desired height – this will stop the mower from scalping the lawn.

- **Fertilising:** Apply LSA Lawn Fertiliser every 6 weeks with a slow-release granular fertiliser, Exceed every 3 weeks with a liquid fertiliser.
- **Watering:** Water deeply (soaking the top 100mm of soil) initially. After this, Sir Grange will require watering at least twice a week with a minimum of 15mm of water at a time.

SUMMER

- **Mowing:** Maintain mowing every 10–14 days. Ensure your blades are sharp to prevent tearing the fine leaf blades.

- **Fertilising:** Apply LSA Lawn Fertiliser every 6 weeks, following label directions.

- **Pest Control:** Apply Acepelryn GR or LSA Grub Guard Ultimate for season long control.

- **Watering:** Water 3 times per week with a minimum of 15mm of water at a time, early in the morning. During periods of extreme heat, watering during the hottest part of the day for 5 minutes will help to cool the lawn, known as 'syringe irrigating' and has a great effect on Sir Grange.

AUTUMN

- **Mowing:** As temperatures begin to cool, gradually let the grass grow a little taller (up to 50mm heading into winter).

- **Fertilising:** Apply your final granular feed, we recommend Oxafert, in March to strengthen the root system for winter.

- **Colour:** Applying ColourGuard Plus before you lose growth will ensure your lawn stays green throughout the winter months. This also offers the addition of essential nutrients for the plant.

WINTER

- **Mowing:** Growth slows right down. You only need to mow once every 2 to 4 weeks just to trim the tips and keep the lawn neat. Always use a catcher during this time.

- **Fertilising:** Do not apply nitrogen. Instead, apply Iron Guard Plus in June or July to enhance winter colour.

- **Watering:** Reduce watering significantly. Only irrigate if the lawn is severely drying out.
